AUTHORS: Pokatilov, Ye.P., Kechashina, A.

TITLE: The activation energy of partly shielded donor centers in silicon

PERIODICAL: Referativnyy zhurnal, Fizika, no 5, 1961, 271, abstract 5E266  
("Uch. zap. Tiraspol'sk. gos. ped. in-t", 1958 (1960), no 8, 193-  
197)

TEXT: The authors calculated activation energy of small-donor centers in Si in the framework of the single-electron approximation (using, however, shielded potential of interaction). This study is actually a generalization of the work of Fisher and Krylovich (RZhFiz, 1958, no 2, 3772) for the case of anisotropic effective mass. A Yukawa-type potential was adopted as interaction potential; trial wave functions contain 3 variation parameters. The authors have established the relationship between activation energy of an impurity center and the radius of shielding. It turned out that activation energy decreases with a decrease of shielding radius, and may even reach the zero-value. Thus, e.g. in the case of complete absence of degeneration and at  $T = 100^{\circ}\text{K}$  the concentration

Card 1/2

of free carriers, at which activation energy turns into zero, amounts to  $\sim 8 \times 10^{17}$  cm $^{-3}$ , which is in accord with the known data of Pirson and Bardin ( $\sim 10^{18}$  cm $^{-3}$ ). The authors consider also the case of non-spherical shielding of interaction potential, and pertaining relationships are derived.

HOL

Effect of conditioned and unconditioned painful stimulation on metabolism of ascorbic acid in the animal organism. G. X. Baryet-yan, Y. A. Kechek, and G. V. Matlyan (*J. Physiol., USSR*, 1961, **67**, 238-239).—Painful stimulation caused in dogs by electrical shock was followed by rise in the excretion of ascorbic acid in the urine and a fall in its blood level. Visual and auditory conditioned stimuli were associated with the painful stimulus and could later alone cause increased excretion of ascorbic acid. The results may explain the increased need for ascorbic acid in painful conditions such as burns, etc.

.. New nephelometric method of determination of protein fractions in the serum and plasma of the blood. Yu. A. Kechik (Med. Inst., Erevan). Izv. Akad. Nauk Armenia. Ser. K. Biol. i Sel'skokhoz. Nauki 7, No. 10, 73-85 (in Russian; in Armenian, 85-6) (1954). - A description is given of the prepn. of a standard soln. for nephelometry in detn. of proteins and their fractions. The most satisfactory standard is the AgCl soln., prepd. as follows: to 1 ml. 95% EtOH and 1 ml. concd. HNO<sub>3</sub>, dilid. 1:4, is added 4 ml. 0.1N NaCl, followed by 0.5 ml. 0.002N AgNO<sub>3</sub>, and the mixt. kept 10 min. at 40°. This standard can be used for nephelometric comparisons with turbidities produced in protein solns. by addns. of (NH<sub>4</sub>)<sub>2</sub>SO<sub>4</sub>. It is noted that the turbidity of such suspensions varies with time. Combination of the nephelometric detns. with those made refractometrically on the protein solns. results in a very satis-factory lab. method for protein estn. G. M. Koshipov

AUTHOR: Arkhipov, R. G.; Kechin, V. V.; Likhter, A. I.; Pospelov, Yu. A.

TITLE: Galvanomagnetic effects in graphite and the deformation of the electron spectrum of graphite under pressure

SOURCE: Zhurnal eksper. i teor. fiziki, v. 44, no. 6, 1963, 1964-1973

TOPIC TAGS: Galvanomagnetic effects in graphite, electron spectrum deformation, magnetoresistance high pressures, temperature dependence of resistance, Hall coefficient

ABSTRACT: A theory of the galvanomagnetic properties of graphite is developed and formulas are derived for the limiting case of high temperatures, using the relaxation-time approximation and the energy spectrum of graphite obtained by Slonczewski and Weiss (Phys. Rev. 109, 272, 1958). The galvanomagnetic coefficients of graphite were also measured under pressures up to 10000 atmospheres and at temperatures up to + 90° C, using a method similar to that described by Likhter and D'yakonova (FTT, v. 1, 95, 1959 and PTE, no 2, 127,

Card 1/32

L 13633-63  
ACCESSION NR: AP3003127

1960). At the same time, the temperature dependence of the coefficients was obtained up to +150°C at atmospheric pressure. The theory makes it possible to separate the effects due to the lattice from those due to the conduction electrons, and the measurement of the galvanomagnetic effect gives satisfactory accuracy and is technically much simpler than the use of other standard methods of determining the energy spectrum (cyclotron resonance, de Haas -- van Alphen effect, absorption of ultrasound, etc.). An analysis of the experimental data on the temperature dependence of the resistance to +150°C, yields a simple dependence of the relaxation time on the temperature and on the quasi-momentum. A combined quantity ( $Q$ ) is defined and is found to be independent of the temperature up to pressures of 10000 atmospheres, so that it can be used to find the dependence of the energy-spectrum parameters on the distance between layers, using measurements of the resistance and galvanomagnetic coefficients as functions of pressure and temperature: this permits determination of the deformation of the energy spectrum of graphite under pressure. At 10000 atmospheres, the total number of carriers in graphite increases by 23% and the relaxation time increases by 3%. "In conclusion it is a pleasure to thank L. F. Vereshchagin for continuous interest and useful discussion." Orig. art. has: 7 figures, 25 formulas, and 1 table.

AUTHORS: Pospelov, Yu. A.; Kechin, V. V.

TITLE: Magnetic field dependence of electrical resistance in graphite

SOURCE: Fizika tverdogo tela, v. 5, no. 12, 1963, 3574-3579

TOPIC TAGS: graphite, electrical resistivity, galvanomagnetic effect, graphite monocrystal, electric resistance, galvanomagnetism, graphite single crystal

ABSTRACT: By using the approximation of relaxation time and solving Boltzmann's equation, the authors have obtained formulas for the galvanomagnetic effects in any arbitrary magnetic field (directed along the trigonal axis, but not reaching such a magnitude that quantum effects begin to play a part). They have compared their results with the experimental dependence of single crystals of graphite in the temperature range 290-450K in fields up to 5000 oersteds and at hydrostatic pressures up to 9000 atm. This material is summarized in Figs. 1 and 2 on the Enclosures. "In conclusion, we take this opportunity to express our thanks to R. G. Arkhipov and A. I. Lichten for useful discussions of the work." Orig. art. has: 4 figures, 2 tables, and 27 formulas.

36-46

TOPIC TAGS: <sup>21</sup> antimony, galvanomagnetic effect, Hall constant, specific resistance, magnetoresistance, crystal lattice structure, pressure effect

ABSTRACT: To determine the variation of the energy spectrum of antimony, accompanying a gradual reduction of the crystal parameter ratio c/a and of the corner angle difference  $60^\circ - \alpha$  under high hydrostatic pressure, the authors investigated the pressure dependence of certain galvanomagnetic coefficients at room temperature. The coefficients studied were the two resistivity components, the two Hall coefficients, and the eight magnetoresistance components, which were measured at pressures up to 10,000 atm. The apparatus employed was described earlier (FTT v. 5, 3066, 1963). The preparation and the installation of the samples are described. Measurements were also made of the temperature dependence of these coefficients at 293, 273, 195, and 77K under atmospheric pressure. The results show that the num-

3

ber of carriers is independent of the temperature ( $T$ ), but the mobility is proportional to  $T^P$  ( $p = 1.3--1.4$ ). The deformation of the electronic Fermi surface by the pressure is calculated. The carrier density is shown to decrease under pressure. The effective mass anisotropy increases with the increasing pressure, but the tilt of the electronic ellipsoids is decreased by about  $7^\circ$  at 10,000 atm. ABSTRACT: Concerning the analysis of galvanomagnetic characteristics  
of bismuth-type metals

JOURNAL: Fizika tverdogo tela, v. 6, no. 11, 1964, 3206-3216

TOPIC TAGS: galvanomagnetic effect, kinetic equation, Fermi surface

ABSTRACT: In view of the information that can be gained from galvanomagnetic measurements on the relaxation processes in metals, the authors propose a new method for analyzing the galvanomagnetic characteristics of metals of the bismuth type. The method is based on separating the galvanomagnetic characteristics that depend only on the "electronic" part of the Fermi surface, which is assumed to have a three-ellipsoid configuration, with no special assumptions made concerning the "hole" surface, other than the symmetry properties

Card 1/2

L 14431-65

ACCESSION NR: AP4048389

3

which follow from this surface from the analysis of A. A. Abrikosov  
and L. A. Fal'kovskiy (ZhETF v. 44, 1963, 1965). The Boltzmann equation  
is solved in the  $\tau$ -approximation and five formulas are derived  
for the magnetic coefficients. If  $\omega$  and  $\beta$  the parameters of the  
"soft core" Fermi surface are evaluated. The authors thank R. S.  
Dorokhov and A. I. Likhter for a useful discussion. Orig. art. has:  
 $\tau$ ,  $\omega$  and  $\beta$  formulas.

TITLE: Comparative study of the photochemical chlorination of ethyltrichlorogermane and ethyltrichlorosilane

SOURCE: AN SSSR. Izvestiya. Seriya khimicheskaya, no. 12, 1966, 2215-2216

TOPIC TAGS: chlorination, photochemistry, silane

SUB CODE: 07

ABSTRACT: In the light of earlier studies, indicating that the orienting effect of the  $\text{Cl}_3\text{Ge}$  group is substantially greater than that of the  $\text{Cl}_3\text{Si}$  group in the chlorination of ethyltrichlorogermane and ethyltrichlorosilane with sulfuryl chloride in the presence of benzoyl peroxide, the authors investigated the photochemical chlorination of ethyltrichlorogermane in comparison with ethyltrichlorosilane, comparing the orienting abilities of the  $\text{Cl}_3\text{Ge}$  and  $\text{Cl}_3\text{Si}$  groups of these compounds under the conditions of photochemical chlorination. In the photochemical chlorination of ethyltrichlorogermane,  $\alpha$ - and  $\beta$ -chloroethyl-

APPROVED FOR RELEASE: 06/13/2000 CIA-RDP86-00513R000721410018-7"

trichlorogermans were obtained in a 1:4 ratio, in contrast to the 1:2.3 ratio of the  $\alpha$ - and  $\beta$ -isomers obtained in the chlorination of ethyltrichlorosilane. The stronger  $\beta$ -orienting ability of the trichlorogermane group in comparison with the trichlorosilane group was thus confirmed. It was found that the latent period of chlorination is substantially shorter for ethyltrichlorosilane,

than for ethyltrichlorogermane. The ratio of the  $\alpha$ - and  $\beta$ -isomers for both ethyltrichlorogermane and ethyltrichlorosilane is fixed at the very start of chlorination and remains comparatively constant during the entire reaction.

Title : Euphylline in the Therapy of Coronary Insufficiency.

Orig Pub: Terapevt. arkhiv, 1957, 29, No 11, 14-23.

Abstract: The status of the circulation and of the contractile function of the myocardium under the action of euphylline (I) therapy was investigated in 55 patients with chronic coronary insufficiency. Because of side-effects I therapy had to be discontinued in 17 patients. In 14 patients, injection of I decreased the frequency of attacks of angina, the intensity and duration of the anginal pains and produced improvement in the objective findings.
